1. Integration of Modules:
   - Combining certain queries and deleting unnecessary queries. One problem is integrating the allusers table and the individual user type tables (student, alumni, etc.) from the ADS system with the other two systems. Currently, the ADS system uses the allusers primary key (user_id) to log users and serve as the navigation identifier between the different pages. However, the other system uses a username string to login and identify a specific user.
   - The team needs to identify which layout to use so that the aesthetics of the user interface are consistent between pages. We can either use a new bootstrap layout or choose an existing one between the two systems.
   - Certain pages overlap between the projects, such as the administrator page and the reset button. We need to choose which one to hold onto and which one to discard.
   - We are hoping to minimize the amount of redesign. We are certainly not going to start a schema from scratch. Most likely, we will merge compatible aspects of each design and only redesign or create new tables when needed to accommodate new features. As for the styling layout, we will most likely vote on the most aesthetically pleasing/functional layout and stick with it.

2. User Interface:
   - We will vote on the existing UI and choose the most aesthetically pleasing/functional one.
   - We have already demonstrated our UI to each other and are still working out the details of the changes that need to be implemented.
   - I think initially we are inclined to go towards a bootstrap layout as the majority of the group uses this layout and it is easy to be uniform when using bootstrap.
   - In the REGS UI I have a header that includes a navigation menu with all the different pages the user can go to. This might need to be changes as the pages a single user will be able to go to will change.

3. Five questions on clarification of Phase 2 specs
   - Can a student that has not been admitted be able to see any of the classes being offered in the registration system?
   - Does the sysadmin create a new account when someone has been admitted or do they login with their old application account to view classes etc?
